Supplementary figure 1: Stimulus-dependent (TNF α , IFN γ or IFN α , respectively) gene expression of IP-10 and SIGLEC1 (CD169) in in-vitro stimulated whole blood samples. After stimulation for 90 minutes, monocytes were isolated by fluorescence activated cell sorting and gene expression was analyzed by whole genome gene arrays (Affymetrix HG-U133 Plus 2.0). Fold change values were calculated by GeneChip[®] Operating Software (GCOS) comparing stimulated and unstimulated monocytes.
